

ABSTRACT

5 The present invention provides a wireless communications
system comprising a first radio transceiver configured to
communicate on a first radio channel, a second radio
transceiver configured to communicate on a second radio
channel, a first base transceiver unit (BTU) configured to
communicate with the first radio transceiver, a second BTU
10 configured to communicate with the second radio
transceiver, and a client transceiver unit (CTU)
configured to communicate with both the first BTU and the
second BTU. The CTU is thereby configured to communicate
on the first radio channel via the first radio transceiver
15 and the first BTU. The CTU is also configured to
communicate on the second radio channel via the second
radio transceiver and the second BTU. The CTU comprises at
least one speaker for enabling a user to listen to
communications on the first and second radio channels
20 concurrently.
